	PATENT NO.	KIND	DATE	APPLICATION NO.	DATE
PI	US 3721587	A	19730320	US 1970-94618	19701202
PRAI	US 1968-749273		19680801		

AB **Steel** for hot-rolled shapes free large **elongated** silicate inclusions and therefore esp. resistant to cracks when bent cold preferably contains **C** 0.02-0.08, **Mn** 0.25-0.8. Si .ltoreq.0.05, Al 0.006-0.018, Nb 0.025-0.045, Cu .ltoreq.0.25, S .ltoreq.0.03, P .ltoreq.0.02, and **N** 0.002-0.01%. The Nb provides a fine **grain** size with good strength and toughness in spite of low **C** and **Mn**. The ingots are preferably semikilled to prevent deep piping and soundness is increased by chilling the ingot tops with water 4-6 in. deep as soon as they have solidified, preventing internal oxidn. Deoxidn. is preferably controlled with Al in the molds. Plates or strip **can** be rolled at 2200-350.degree.F, the last pass giving 10-15% redn. at <1800.degree.F. By spray-cooling the finished shapes, the yield strength **can** be increased, sometimes as much as 10,000 psi; but when the **C** content is low, this generally decreases the notch toughness. Test data are presented on slabs and strips produced from 4-ton ingots of semikilled basic O-refined **steel**, each ingot being modified by various mold addns. Clean Al-treated spray-cooled **steel** had 57,100 psi lengthwise yield strength, 68,700 psi tensile strength, 22.5% **elongation**, 74.9% redn. of area, and 8.5 ft-lb notch-impact strength at 0.degree.F.
